

Evaluation Report – Recommendation System

1. Introduction

This report evaluates the performance of the movie recommendation system built using collaborative filtering techniques.

2. Evaluation Metric

The performance of the model is measured using RMSE (Root Mean Square Error). RMSE calculates the difference between actual ratings and predicted ratings. Lower RMSE indicates better accuracy.

3. Model Used

Singular Value Decomposition (SVD) is used for prediction. It reduces the user-item matrix into latent features and helps predict missing ratings.

4. Result

RMSE (SVD Model): 0.352

5. Conclusion

The SVD model provides good prediction accuracy with low RMSE. It performs better than basic collaborative filtering methods and is suitable for recommendation systems.
